

Climate Dashboard — Design Ideas

DRMIS — Disaster Risk Management Information System

Dashboard Mockup

Below is a conceptual mockup of the Climate view within the unified DRMIS dashboard for Vanuatu. Disaster and Climate are the same dashboard; the header toggle switches between them. A **dropdown** selects the active climate module — when one is chosen (e.g. Coastal changes), only that module's indicators and maps are displayed; no mixing of content from other modules. Shown with DRMIS header, module dropdown, map, and context panel.

Sample: Coastal Changes module — Below is a reference layout showing the module dropdown, map with legend and time slider, and context panel with shoreline charts:

DRMIS Header (Current)

Disaster and Climate are within the same dashboard. A toggle button in the header switches between the two views — users stay in one unified DRMIS dashboard and switch modes via the toggle. One system logo (DRMIS — blue shield with bars) is used for both; no separate MIS logo.

- **Left:** DRMIS logo (shield icon), "DRMIS" title, "Disaster Risk Management Information System" subtitle
- **Center:** Disaster / Climate toggle button — switches between Disaster view and Climate view within the same dashboard
- **Right:** Theme toggle (light/dark), User avatar (circular icon)

User avatar dropdown — When the user clicks the avatar, a dropdown opens with:

- Username (e.g. "admin")
- Help
- Profile & security
- Share
- Lock screen (if pin is set)
- Admin (staff only)

- Logout (styled in red)

Logout is already in this dropdown; no separate logout control is needed in the main navigation.

UN / World Bank Dashboard Standards Applied

The design draws on established international practices:

- **World Bank:** Hierarchical structure — overview metrics first, then drill-down by filters (country/region, year, indicator)
- **UN SDG:** Category-based browsing with thematic icons (Land, Water, Ecosystems, Climate)
- **IPCC:** M.A.D.E principle (Message, Audience, Design, Evaluation); clear intent; accessible colors (no rainbow); colorblind-friendly palettes
- **DataBank / Open Data:** Interactive maps, filter panels, embeddable visualizations, mobile-optimized

1. Climate Dashboard Layout (Visual Structure)

Based on the Coastal Changes sample mockup. Disaster and Climate share the same dashboard; the header toggle switches between them.

1.1 Header Row (fixed, full width)

Area	Content
Left	DRMIS logo, title, subtitle
Center	Disaster / Climate toggle
Right	Module dropdown (Climate mode only), Time range, Location, View mode filters; Theme toggle; User avatar

1.2 Main Content (below header)

Zone	Width	Content
Map area	~65–70%	Module title (e.g. "Coastal Changes"); Map with layer dropdown, zoom/pan/search controls; Single legend (bottom-left overlay); Time slider (bottom)
Context panel	~30–35%	Section title (e.g. "COASTAL ANALYSIS"); Module-specific charts (line, bar); No duplicate legend

1.3 Map Controls (on map overlay)

- **Top-left:** Layer/data dropdown (e.g. "Historical Shoreline Change (2000–2023)")
- **Left edge:** Zoom in/out, pan, recenter, search
- **Top-right:** Layers, print, full-screen
- **Bottom-left:** Single legend (e.g. Shoreline change: High Erosion, Accretion, Erosion, Stable)
- **Bottom:** Time slider (e.g. 2000–2023)

1.4 Context Panel (right)

- **Shared filters:** Time range, Location (Province/Area Council), View mode
- **Module-specific:** Charts only — e.g. Coastal: Annual Shoreline Position (line), Regional Erosion & Accretion (bar)
- **No legend duplication** — legend stays on map

2. Layout Options (Standards-Aligned)

Zone	Purpose
Top row	Overview KPI cards (optional); Module dropdown; Shared filters
Map	Primary visualization — selected module's layers only; no mixing
Context panel	Filters, charts, drill-down — module-specific; no duplicate legend

Benefits: follows international standards; clear hierarchy; optimized for climate data exploration.

3. Module Dropdown (One at a Time)

Use a **dropdown** to switch between the seven climate modules. Do not display all indicators from all modules at once — when one module is selected, only that module's content is shown:

- Land Use / Land Cover Classification

- Coastal changes
- Assessing Flood Risk from Past Weather
- Climate indicators
- Marine heat waves
- Coral reef mapping
- Soil health

Example: When "Coastal changes" is selected, only coastal-related indicators, maps, and charts are displayed. No mixing with Land Use, Flood Risk, or other modules.

4. Map and Context Panel (Module-Specific)

- **Map:** Shows only the selected module's layers (e.g. Coastal changes → coastal erosion/accretion map)
- **Context panel:** KPIs and charts for the selected module only
- **Single legend only:** Do not duplicate legends — use one legend per module, either on the map overlay or in the context panel, not both. Avoid redundant entries (e.g. "High Erosion" or "Stable" appearing twice).
- **No mixing:** Switching between modules replaces all content; no overlap of indicators

5. Context Panel Content by Module

Module	Right panel content
Land Use / Land Cover	Legend, class breakdown (pie/bar), area stats
Coastal changes	Single legend (shoreline change: High Erosion, Accretion, Erosion, Stable), time slider, shoreline position chart, erosion/accretion stats
Flood Risk	Risk level legend, historical events, probability chart
Climate indicators	Time series, trend charts, anomaly maps

Marine heat waves	Duration/intensity chart, heat map legend
Coral reef mapping	Reef health legend, coverage %, bleaching index
Soil health	Soil type legend, health index, degradation metrics

6. Shared Controls and Filters

Reuse existing controls: AreaSelect (province, area council), YearSelect, AttributeFilterSelect, DownloadDataDialog. Add a Time range control for modules that need multi-year or seasonal views.

7. Real-World Accurate Text

All labels, metrics, legends, and dropdowns should use actual real-world accurate text — no placeholders or gibberish. Examples:

- **KPI subtitles:** "Vanuatu national average", "vs. 30-year baseline", "+1.07 mm/yr trend", "per capita 2022"
- **Data types:** "Sea surface temperature", "Climate indicators", "Land use / land cover"
- **Date ranges:** "Last 12 months", "2020–2024", "All data"
- **Legends:** One legend per module — no duplicates on map and panel. Proper units (e.g. °C, mm/yr, tCO₂/cap) and valid ranges (e.g. -1.5 to 1.5 °C). Fix typos (e.g. "Erorotion" → "Erosion").
- **Region:** "Vanuatu" (not "Vanuatu rand" or similar)

8. Visual Hierarchy and Theming

- Use a distinct accent for Climate mode (e.g. green/teal) vs Disaster (amber/red)
- Keep the same glass-style header and sidebar styling
- Use icons per module (LuTreePine, LuWaves, LuDroplets, LuThermometer, LuFish, LuSprout)

9. Progressive Rollout

1. **Phase 1:** Enable Climate mode with the full layout (map + sidebars) instead of the placeholder
2. **Phase 2:** Add one or two modules first (e.g. LULC + Climate indicators)
3. **Phase 3:** Add remaining modules as data and APIs become available
4. **Phase 4:** Add further modules as data becomes available

10. Recommended Architecture

1. Remove the full-screen placeholder — show the same three-column layout in Climate mode
2. Add `ClimateSection` — module dropdown; when selected, show only that module's layers and context panel content
3. Use a "Climate" cluster — or a dedicated cluster per module for datasets
4. Extend `ContextPanelContent` — add climate-specific content based on active module
5. Reuse map components — `VectorLayers`, `PMTilesLayers`, `TabularLayer` for climate layers
6. Add a Climate mode badge — small header badge for quick recognition

11. Backend: Disaster vs Climate Availability

Vector and PMTiles datasets have two checkboxes in the admin:

- **Available in Disaster** — when checked, the dataset appears in Disaster mode
- **Available in Climate** — when checked, the dataset appears in Climate mode

Both checked = available in both. One only = that mode only. The API filters by `scenario` (disaster/climate) when returning datasets.

12. Data Model Considerations

- **LULC:** Raster or vector, with class codes and labels

- **Coastal / Flood / Marine / Coral:** Raster or vector, possibly PMTiles for large areas
- **Climate indicators:** Time series + optional raster for spatial view
- **Soil health:** Vector or raster with attributes

Summary

Decision	Recommendation
Dashboard	Single dashboard; Disaster and Climate are two views switched via header toggle
Layout	UN/World Bank-style: overview KPIs → map → drill-down; optimized for climate, not tied to Disaster layout
Module selector	Dropdown to switch between modules; one module at a time — content and maps are module-specific, no mixing
Map	Primary visualization; interactive, filterable by province/area/year
Context panel	Filters, legend, charts, KPIs — module-specific content
Rollout	Progressive, module by module
Theming	IPCC-accessible palettes; avoid rainbow; colorblind-friendly
